Pingdom Website Speed Test

Enter a URL to test the load time of that page, analyze it and find bottlenecks

Page Analysis

History

Performance Grade

Page Speed Performance

Recommendation	Grade
Leverage browser caching	17
Minimize redirects	39
Serve static content from a cookieless domain	80
Specify a Vary: Accept-Encoding header	81
Remove query strings from static resources	86
Avoid bad requests	100
Minimize request size	100
Specify a cache validator	100
Performance grade:	75/100

Test vour site everv dav - free tria

We will monitor your uptime and response time and if anything goes wrong we'll let you know. It's super easy – try us out!

State Colors

Nobody Likes a Slow Website

1 of 2 2015-10-09 12:18

The following colors are used in the bars in the waterfall chart to indicate the different stages of a request.

DNS The web browser is looking up DNS information
SSL The web browser is performing a SSL handshake
Connect The web browser is connecting to the server
Send The web browser is sending data to the server
Wait The web browser is waiting for data from the server
Receive The web browser is receiving data from the server

Content Types

The following icons are used to indicate different content types.

HTML HTML document
Javascript JavaScript file
CSS CSS file
Image line
Text/plain Plain text document

Other Any other content type, for example flash files

Warning The request got a 4XX, 5XX response or couldn't be loaded

Redirect The request got a 3XX response and was redirected

Server Response Codes

To make it easy for you to differentiate between the HTTP response codes in the waterfall chart, we've color-coded the text and background of each URL.

URL 3xx The request was redirected to another target
URL 4xx A client error occured, for example 404 page not found
URL 5xx A server error occured, for example 500 internal server error

URL Error Connection error, no response from the server

URL 2xx The server responded with a successful code

We built this Website Speed Test to help you analyze the load speed of your websites and learn how to make them faster. It lets you identify what about a web page is fast, slow, too big, what best practices you're not following, and so on. We have tried to make it useful both to experts and novices alike.

In short, we wanted it to be a easy-to-use tool to help webmasters and web developers everywhere optimize the performance of their websites.

Feature Overview

- Examine all parts of a web page View file sizes, load times, and other details about every single element of a web page (HTML, JavaScript and CSS files, images, etc.). You can sort and filter this list in different ways to identify performance bottlenecks.
- Performance overview We automatically put together plenty of performancerelated statistics for you based on the test result
- Performance grade and tips See how your website conforms to performance best practices from Google Page Speed (similar to Yahoo's Yslow). You can get some great tips on how to speed up your website this way.
- Trace your performance history We save each test for you so you can review
 it later and also see how things change over time (with pretty charts!).
- Test from multiple locations See how fast a website loads in Europe, the United States, etc.
- Share your results We've made it easy for you to perform a test and share it with your friends, work colleagues or web host.

How it works

All tests are done with real web browsers, so the results match the end-user experience exactly. We use a bunch of instances of Google's Chrome web browser to load websites, record performance data, and so on. Tests are done from dedicated Pingdom servers

About Pingdom

Pingdom offers cost-effective and reliable server, network and website monitoring. We use a global network of servers to monitor our customers' sites 24/7, all year long. The service includes statistics for uptime and response time, and can send out alerts via SMS, email, and more.
